

Twitch Top 1000 Streamers Exploratory Data Analysis

We want to explore this database with basic information regarding top 1000 Twitch streamers, and find which variables have the most impact on "Views gained", an important metric Twitch streamers want to optimize for.

In []:

```
# Imports

import matplotlib.pyplot as plt
import pandas as pd
import seaborn as sns
from sklearn.ensemble import ExtraTreesRegressor
import warnings
```

Reading and Understanding the Data

In []:

```
df = pd.read_csv("twitchdata-update.csv")
df.index = df.index + 1 # To match the indexing with the rank
df
```

Out[]:

Stream (titles)	Stream time(minutes)	Peak viewers	Average viewers	Followers	Followers gained	Views gained	Partnered	Mature	Language
1750	215250	222720	27716	3246298	1734810	93036735	True	False	English
7300	211845	310998	25610	5310163	1370184	89705964	True	False	English
0915	515280	387315	10976	1767635	1023779	102611607	True	True	Portuguese
8140	517740	300575	7714	3944850	703986	106546942	True	False	English
0070	123660	285644	29602	8938903	2068424	78998587	True	False	English
...
4635	13560	21359	9104	601927	562691	2162107	True	False	Spanish
3705	153000	3940	793	213212	52289	4399897	True	False	Korean
2320	217410	6431	567	109068	-4942	3417970	True	False	Korean
1065	104745	10543	1153	547446	109111	3926918	True	False	English
2850	99180	13788	1205	178553	59432	2049420	True	False	French

Now we want to understand the nature of each column.

In []:

```
df.info()
```

```

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 1 to 1000
Data columns (total 11 columns):
 #   Column           Non-Null Count  Dtype  
--- 
 0   Channel          1000 non-null    object  
 1   Watch time(Minutes) 1000 non-null    int64  
 2   Stream time(minutes) 1000 non-null    int64  
 3   Peak viewers      1000 non-null    int64  
 4   Average viewers    1000 non-null    int64  
 5   Followers         1000 non-null    int64  
 6   Followers gained   1000 non-null    int64  
 7   Views gained       1000 non-null    int64  
 8   Partnered         1000 non-null    bool   
 9   Mature             1000 non-null    bool   
 10  Language           1000 non-null    object  
dtypes: bool(2), int64(7), object(2)
memory usage: 72.4+ KB

```

Now we want some basic summary statistics to understand the data better.

In []: df.describe()

	Watch time(Minutes)	Stream time(minutes)	Peak viewers	Average viewers	Followers	Followers gained	Views gained
count	1.000000e+03	1000.000000	1000.000000	1000.000000	1.000000e+03	1.000000e+03	1.000
mean	4.184279e+08	120515.160000	37065.051000	4781.040000	5.700541e+05	2.055185e+05	1.166
std	5.496355e+08	85376.201364	60314.307686	8453.684965	8.044134e+05	3.399137e+05	2.490
min	1.221928e+08	3465.000000	496.000000	235.000000	3.660000e+03	-1.577200e+04	1.757
25%	1.631899e+08	73758.750000	9113.750000	1457.750000	1.705462e+05	4.375825e+04	3.880
50%	2.349908e+08	108240.000000	16676.000000	2425.000000	3.180630e+05	9.835200e+04	6.456
75%	4.337399e+08	141843.750000	37569.750000	4786.250000	6.243322e+05	2.361308e+05	1.219
max	6.196162e+09	521445.000000	639375.000000	147643.000000	8.938903e+06	3.966525e+06	6.701

We also want to look at correlation values for each pair of columns as they might be useful in further analysis.

In []: df.corr()

	Watch time(Minutes)	Stream time(minutes)	Peak viewers	Average viewers	Followers	Followers gained	Views gained	Part
Watch time(Minutes)	1.000000	0.150588	0.582797	0.476165	0.620234	0.514648	0.529862	0.0
Stream time(minutes)	0.150588	1.000000	-0.119540	-0.249248	-0.091299	-0.158165	0.064370	-0.0
Peak viewers	0.582797	-0.119540	1.000000	0.682637	0.532529	0.470415	0.298063	0.0

	Watch time(Minutes)	Stream time(minutes)	Peak viewers	Average viewers	Followers	Followers gained	Views gained	Part
Average viewers	0.476165	-0.249248	0.682637	1.000000	0.428303	0.420097	0.250349	-0.0
Followers	0.620234	-0.091299	0.532529	0.428303	1.000000	0.715618	0.276467	0.0
Followers gained	0.514648	-0.158165	0.470415	0.420097	0.715618	1.000000	0.244297	0.0

◀ ▶

A heat map would be a better way of visualizing this data.

In []:

```
plt.figure(figsize=(15,15))
sns.heatmap(df.corr(), annot=True)
plt.title("Correlation Heatmap", fontsize= 15)
plt.show()
```

Insight: This tells us that the columns in the dataset don't show very high correlation in any given pair, which means that we'll need a combination of factors to answer our initial question. In particular, the Views gained variable shows decent correlation with Watch time, but not much else.

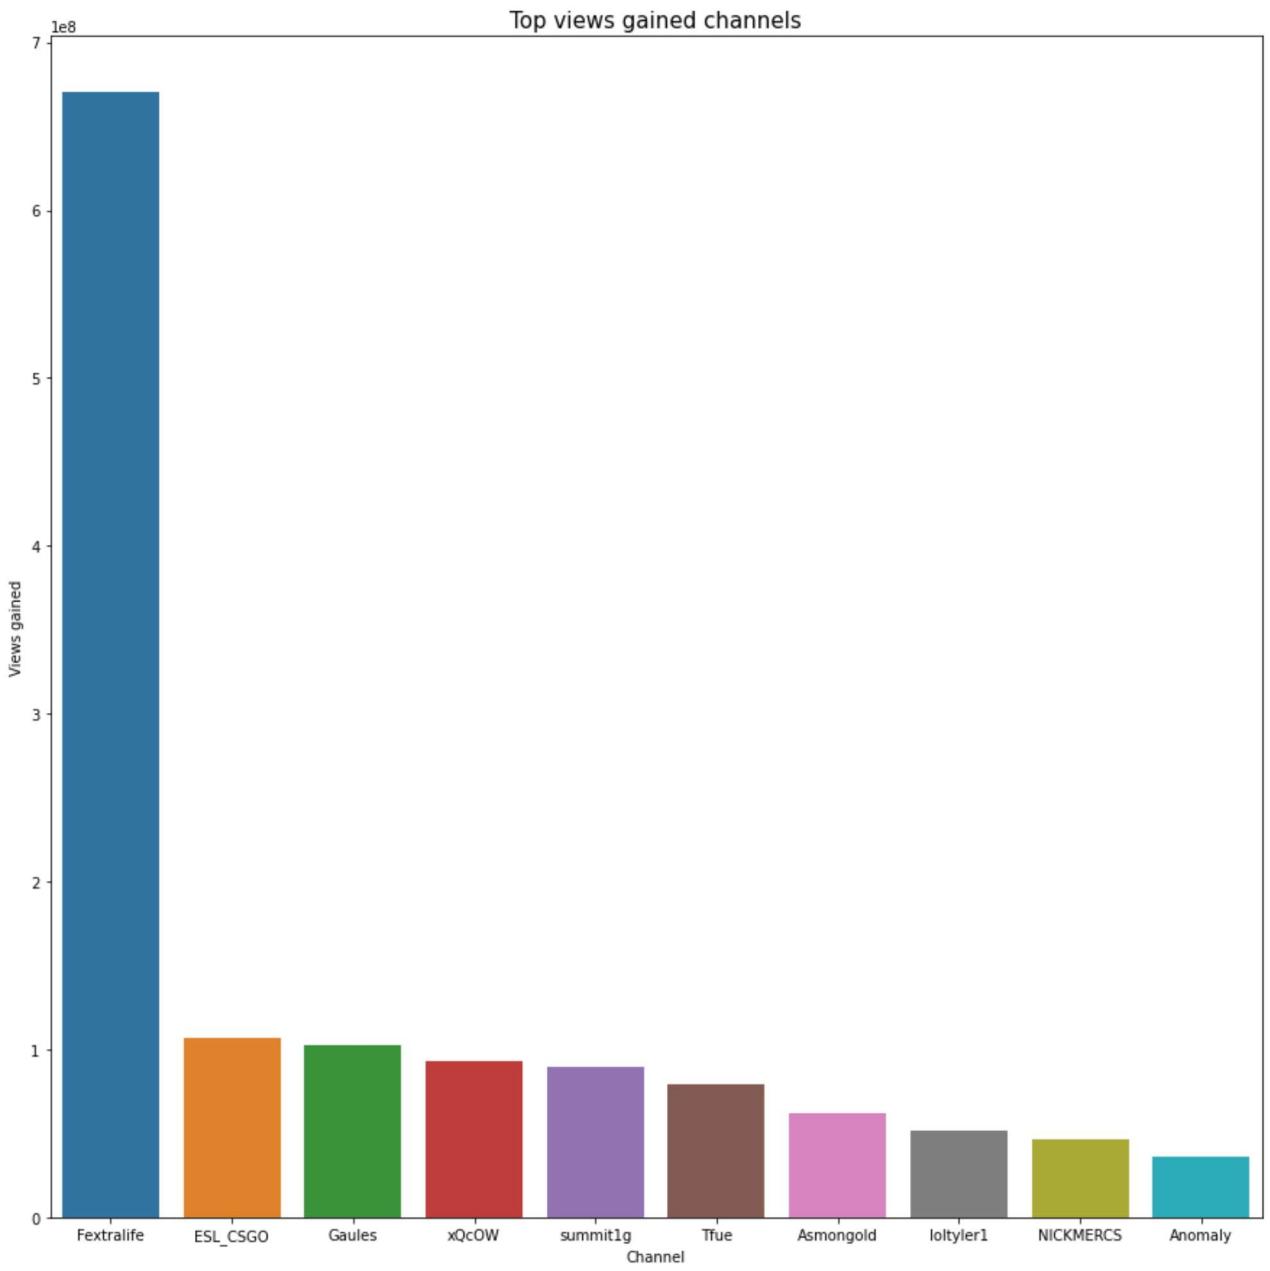

Top Views gained channels

We want to look at the top 10 channels by Views gained to get an idea of what that data is visualized as.

In []:

```
plt.figure(figsize=(15,15))
sns.barplot(x='Channel', y='Views gained', data=df[:10].sort_values(by='Views gained', ascending=False)
plt.title("Top views gained channels", fontsize=15)
```

Out[]: Text(0.5, 1.0, 'Top views gained channels')

Insight: We notice that one particular channel "Fextralife" has an anomalous number of Views gained while all other channels show a relatively stable number of Views gained. This outlier somewhat obscures further visualizations but is an important highlight of the dataset.

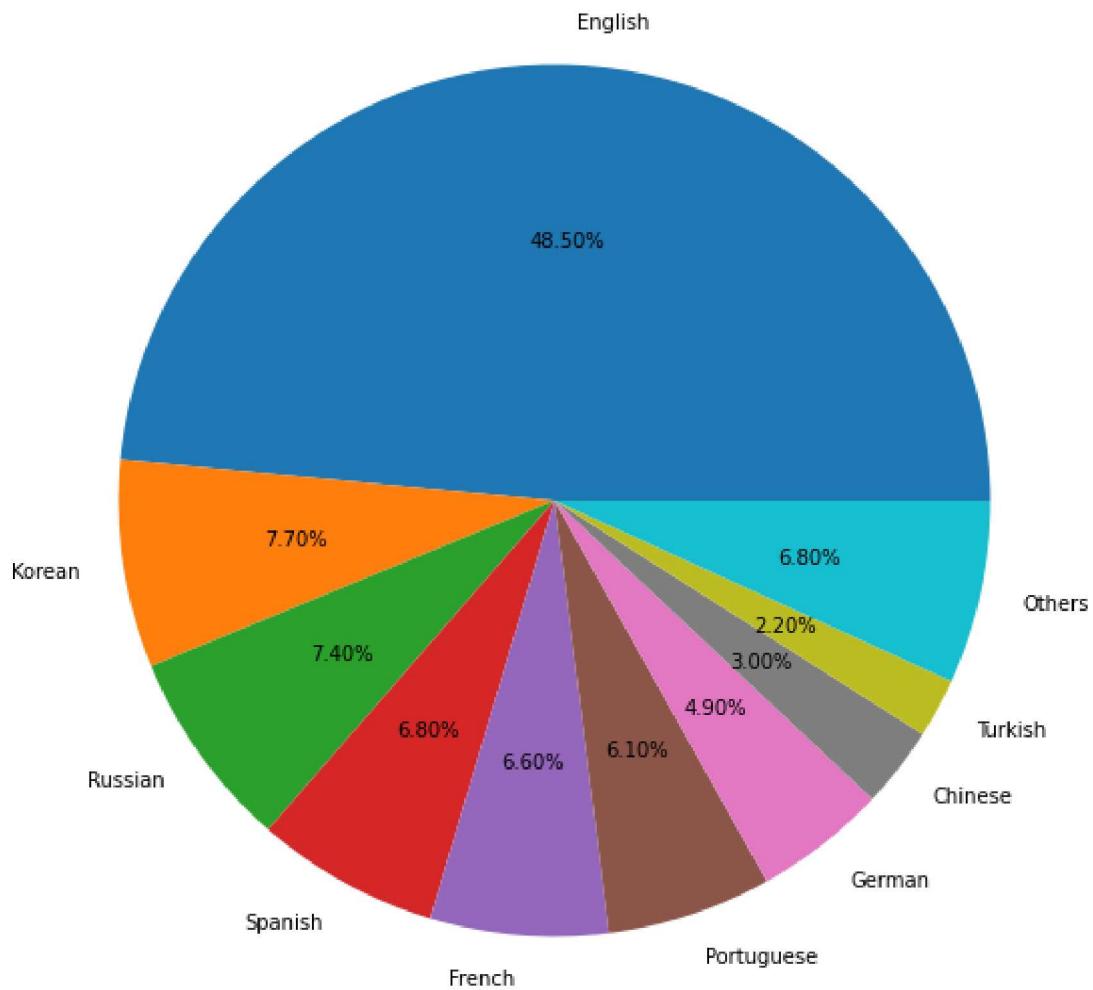

Language Analysis

We want to look at the share of different languages among the top 1000 streamers. We narrow down our major Languages to the top 10 for the clarity of the pie chart.

```
In [ ]: plt.figure(figsize=(15, 10))
language_df = df["Language"].value_counts().to_frame()
language_df = language_df.reset_index()
language_df.columns = ["Language", "Count"]
language_df_top = language_df[:9].copy()
new_row = pd.DataFrame(data= {"Language" : ["Others"], "Count" : [language_df["Count"][-1]}])
language_df_top = pd.concat([language_df_top, new_row])
```

```
plt.pie(language_df_top.Count, labels=language_df_top.Language, autopct="%0.2f%")
plt.title("Percentage of Languages", fontsize=15)
plt.show()
```

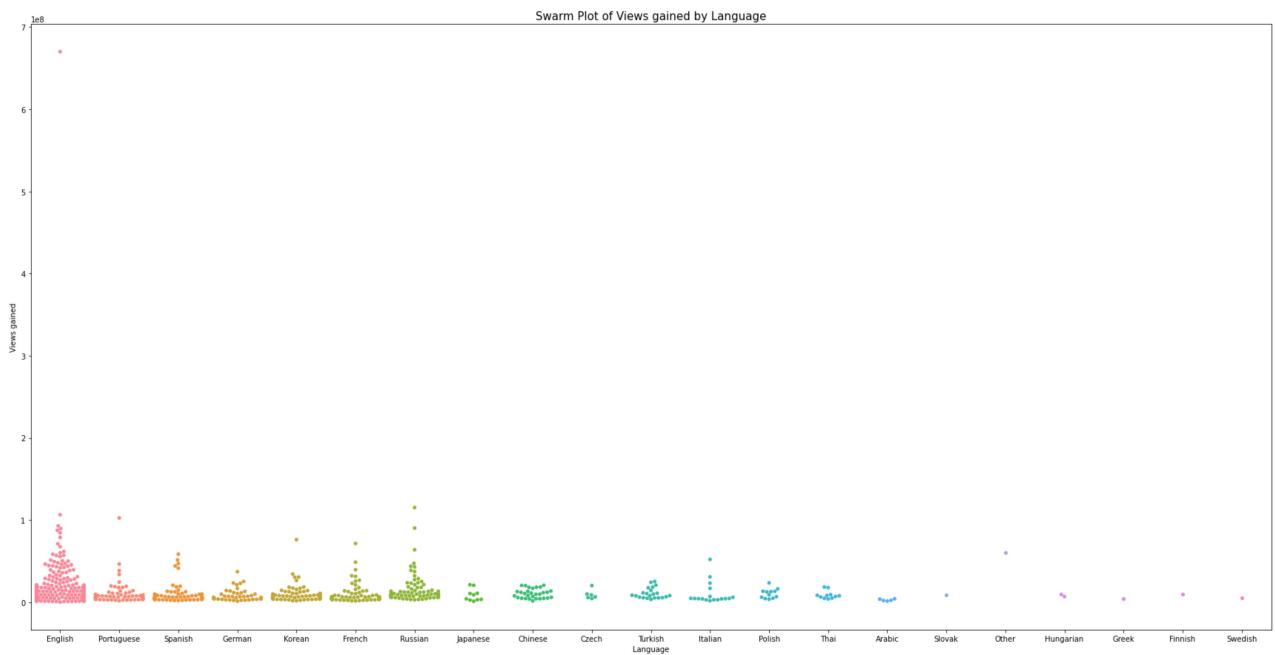

Percentage of Languages

Insight: As expected, English dominates the share of content on Twitch, but we want to see if there is any difference in Views gained based on language. In particular, we expect English language content to gain more views since it caters to a larger population of potential viewers.

Now we want to find out how the distribution of Views gained varies with Language.

```
In [ ]:
warnings.filterwarnings('ignore')
plt.figure(figsize=(30,15))
sns.swarmplot(x="Language" , y = "Views gained" ,data=df)
plt.title("Swarm Plot of Views gained by Language", fontsize=15)
plt.show()
```

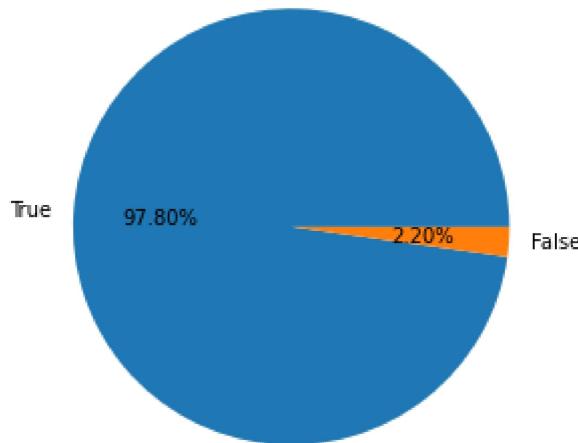

Insight: This plot tells us that there are no particularly striking variations in Views gained based on Language. Even though English content is dominant and can cater to more people, it doesn't show any marked advantage over other Languages, apart from one outlier mentioned above.

Partnered and Mature Content

These are the only two variables that are boolean values. We want to see if there's any link between the two and Views gained.

```
In [ ]:
plt.figure(figsize=(5,5))
partnered = df["Partnered"].value_counts()
plt.pie(partnered.values, labels=partnered.index, autopct="%0.2f%%")
plt.title("Percentage of Partnered Accounts", fontsize=15)
plt.show()
```

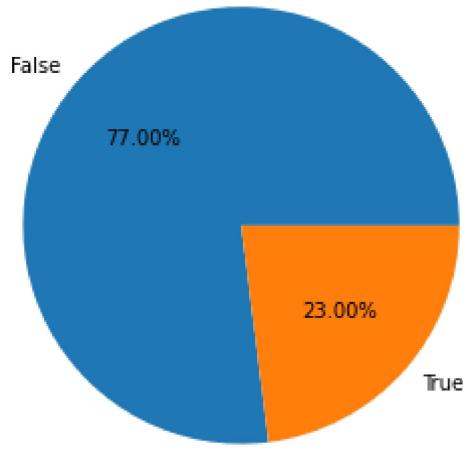

Percentage of Partnered Accounts

```
In [ ]:
```

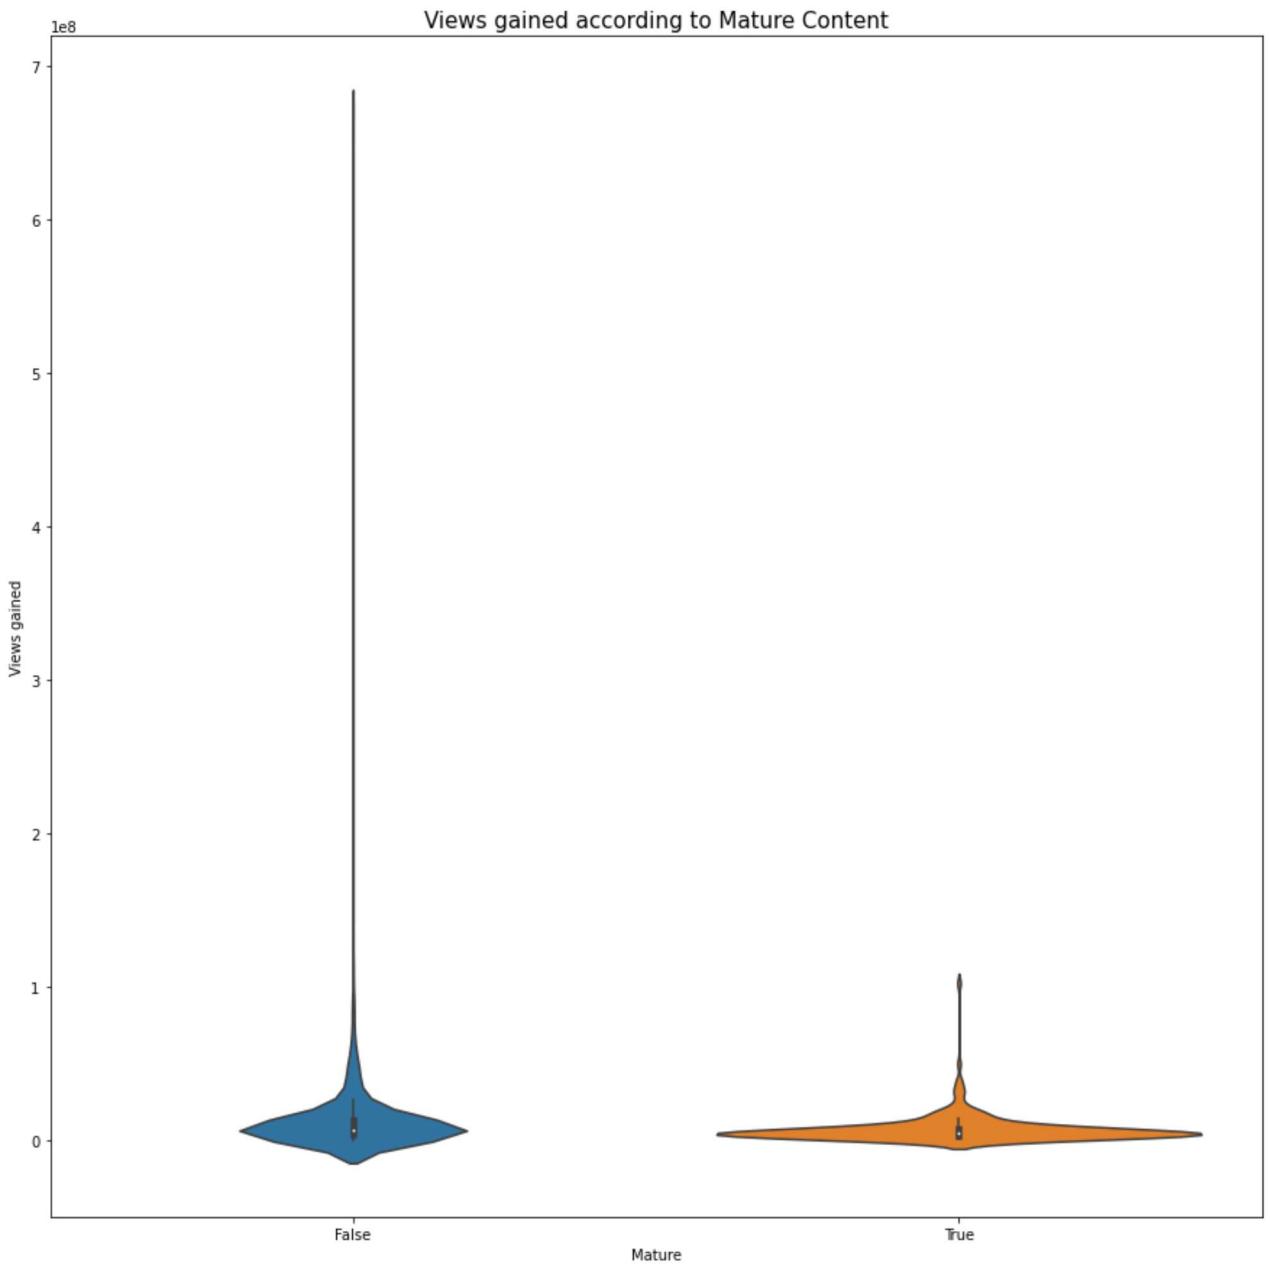

```
plt.figure(figsize=(5,5))
mature = df["Mature"].value_counts()
plt.pie(mature.values, labels=mature.index, autopct="%0.2f%%")
plt.title("Percentage of Mature Accounts", fontsize=15)
plt.show()
```

Percentage of Mature Accounts

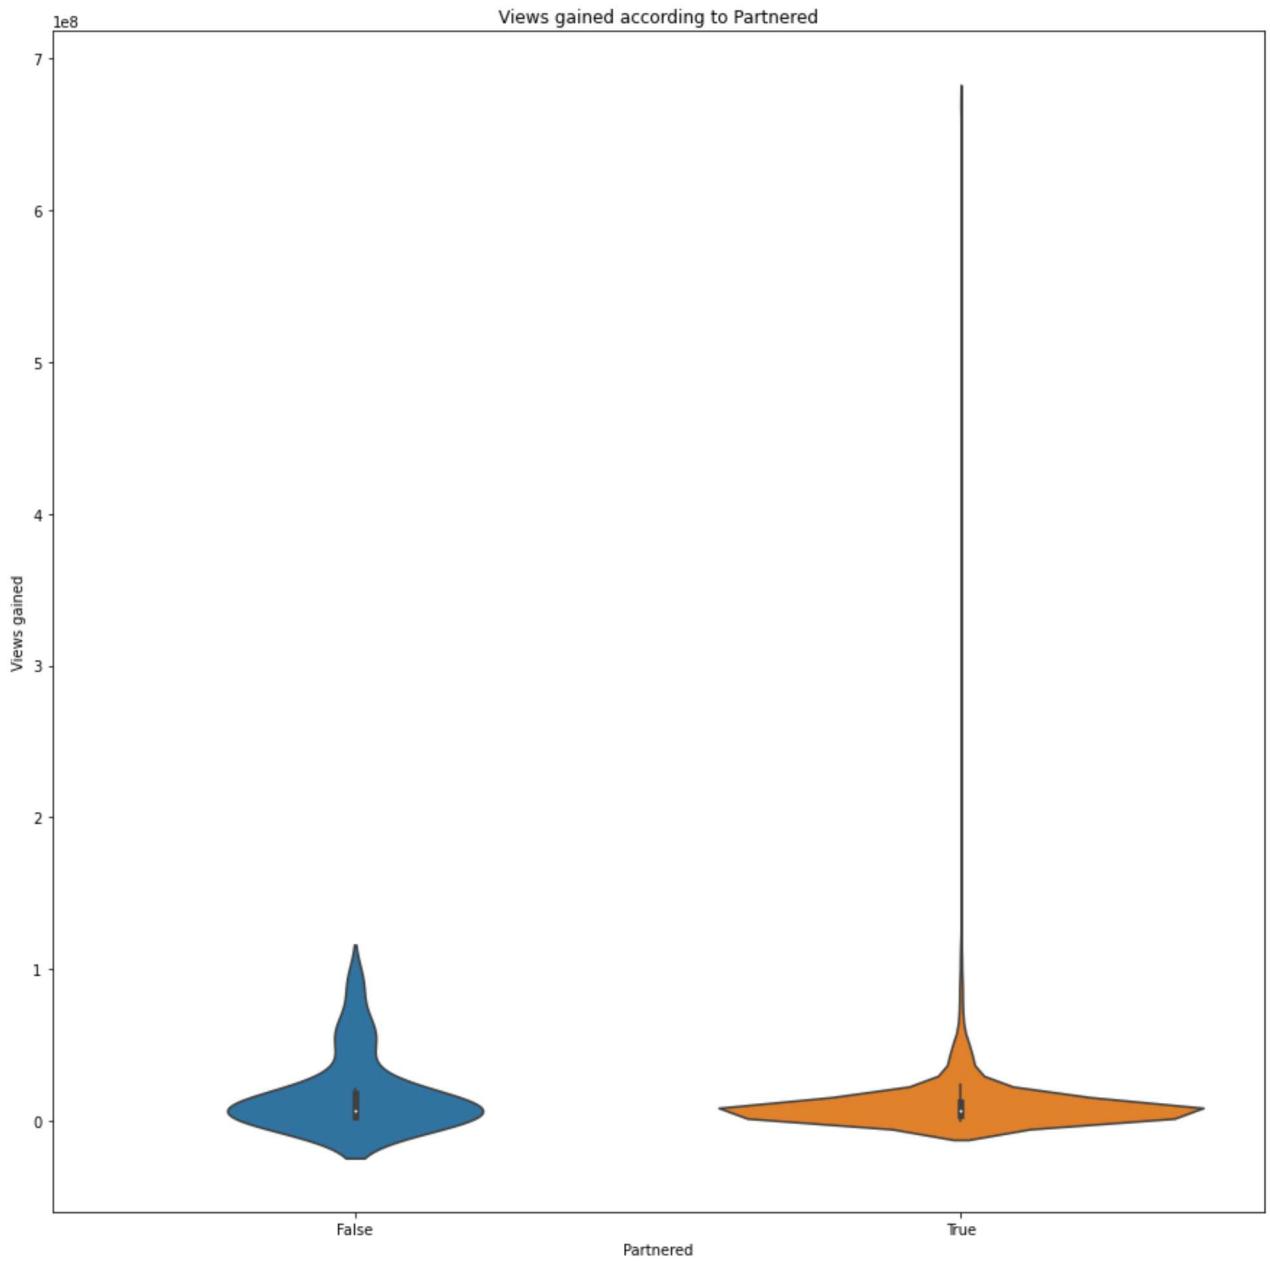

Now we want to see how Views gained varies with Mature content in a stream. Looking at the plot below, it's clear to see that there are more outliers for non-Mature cases, especially one particular one resulting in the abnormal spike.

```
In [ ]: plt.figure(figsize=(15,15))
df = df.explode('Views gained')
sns.violinplot(data=df, x="Mature", y="Views gained")
plt.title("Views gained according to Mature Content", fontsize=15)
plt.show()
```

Now we want to see how Views gained varies with Partnered accounts. In general, we expect Twitch Partnered accounts to do better. Once again, the outlier obscures our plot a little, but comparing the violin plots is still feasible.

```
In [ ]: plt.figure(figsize=(15,15))
df = df.explode('Views gained')
sns.violinplot(data=df, x="Partnered", y="Views gained")
plt.title("Views gained according to Partnered")
plt.show()
```

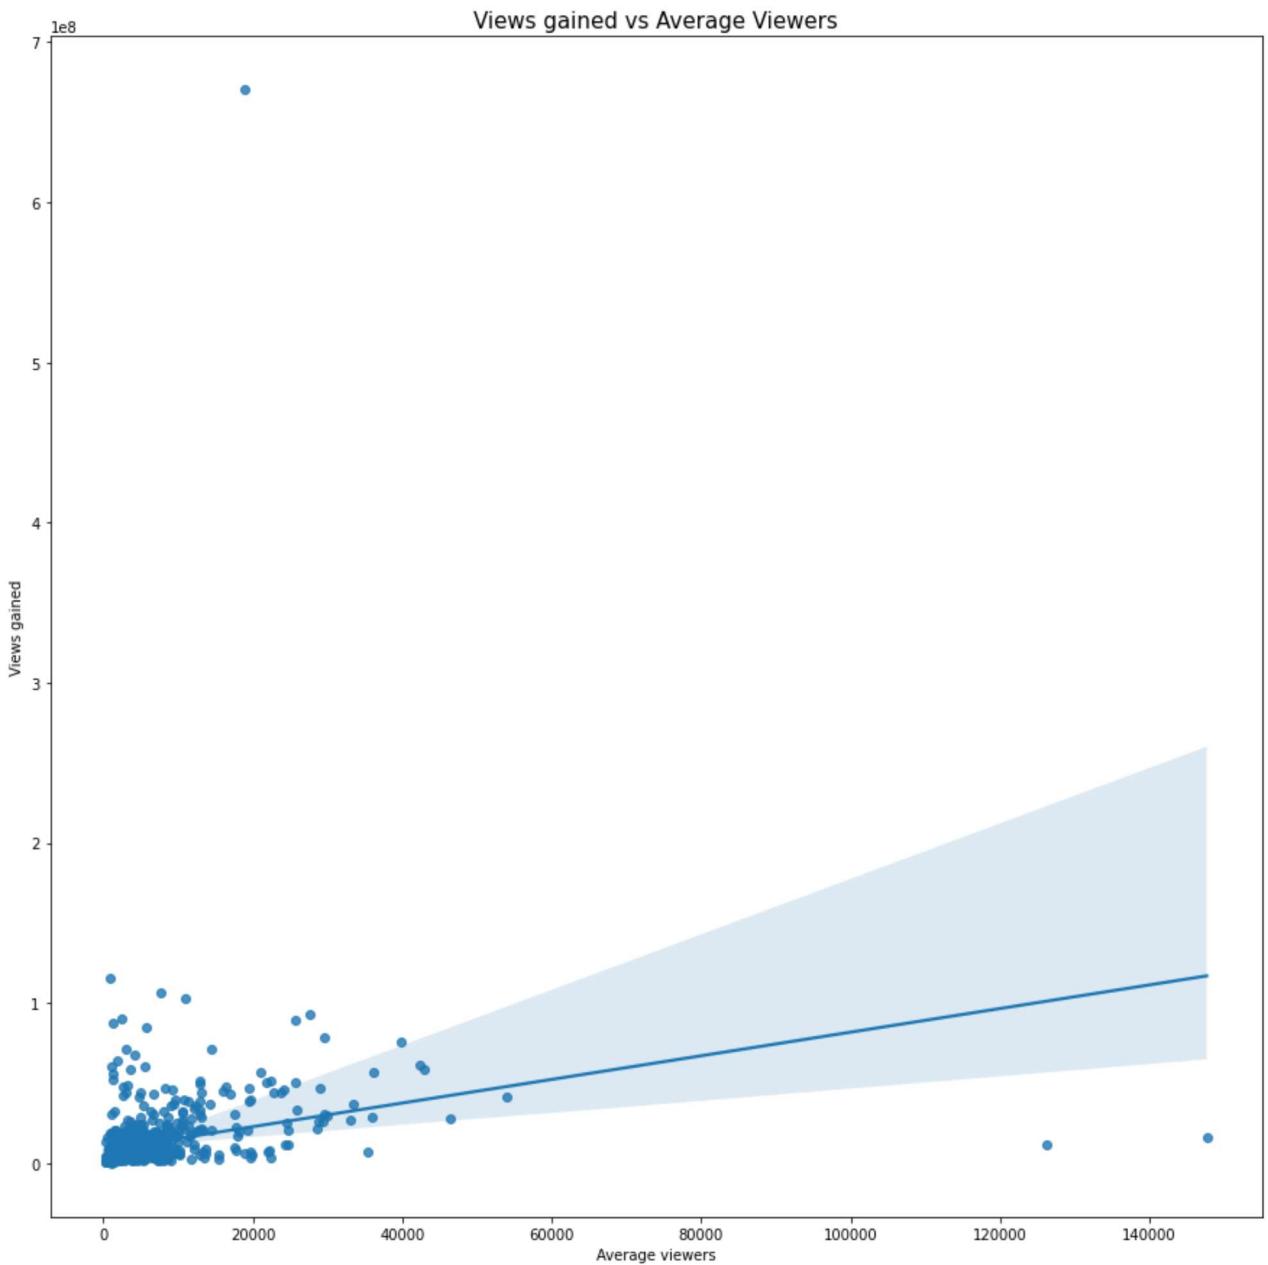

Insights: From the above plots, it's hard to draw any concrete connection between Partnered and Mature content with Views gained. This tells us that these are relatively unimportant characteristics of streams in terms of gaining views. I found this rather surprising as these are usually considered important information regarding a streamer's profile.

Views gained compared to Average Viewers

We want to compare Views gained with the Average views of a channel. In general, channels with more Average views are expected to gain more viewers, since they tend to be more popular in advertisements and SEO.

```
In [ ]: plt.figure(figsize=(15,15))
sns.regplot(x=df["Average viewers"], y=df["Views gained"])
plt.title("Views gained vs Average Viewers", fontsize=15)
```

```
Out[ ]: Text(0.5, 1.0, 'Views gained vs Average Viewers')
```

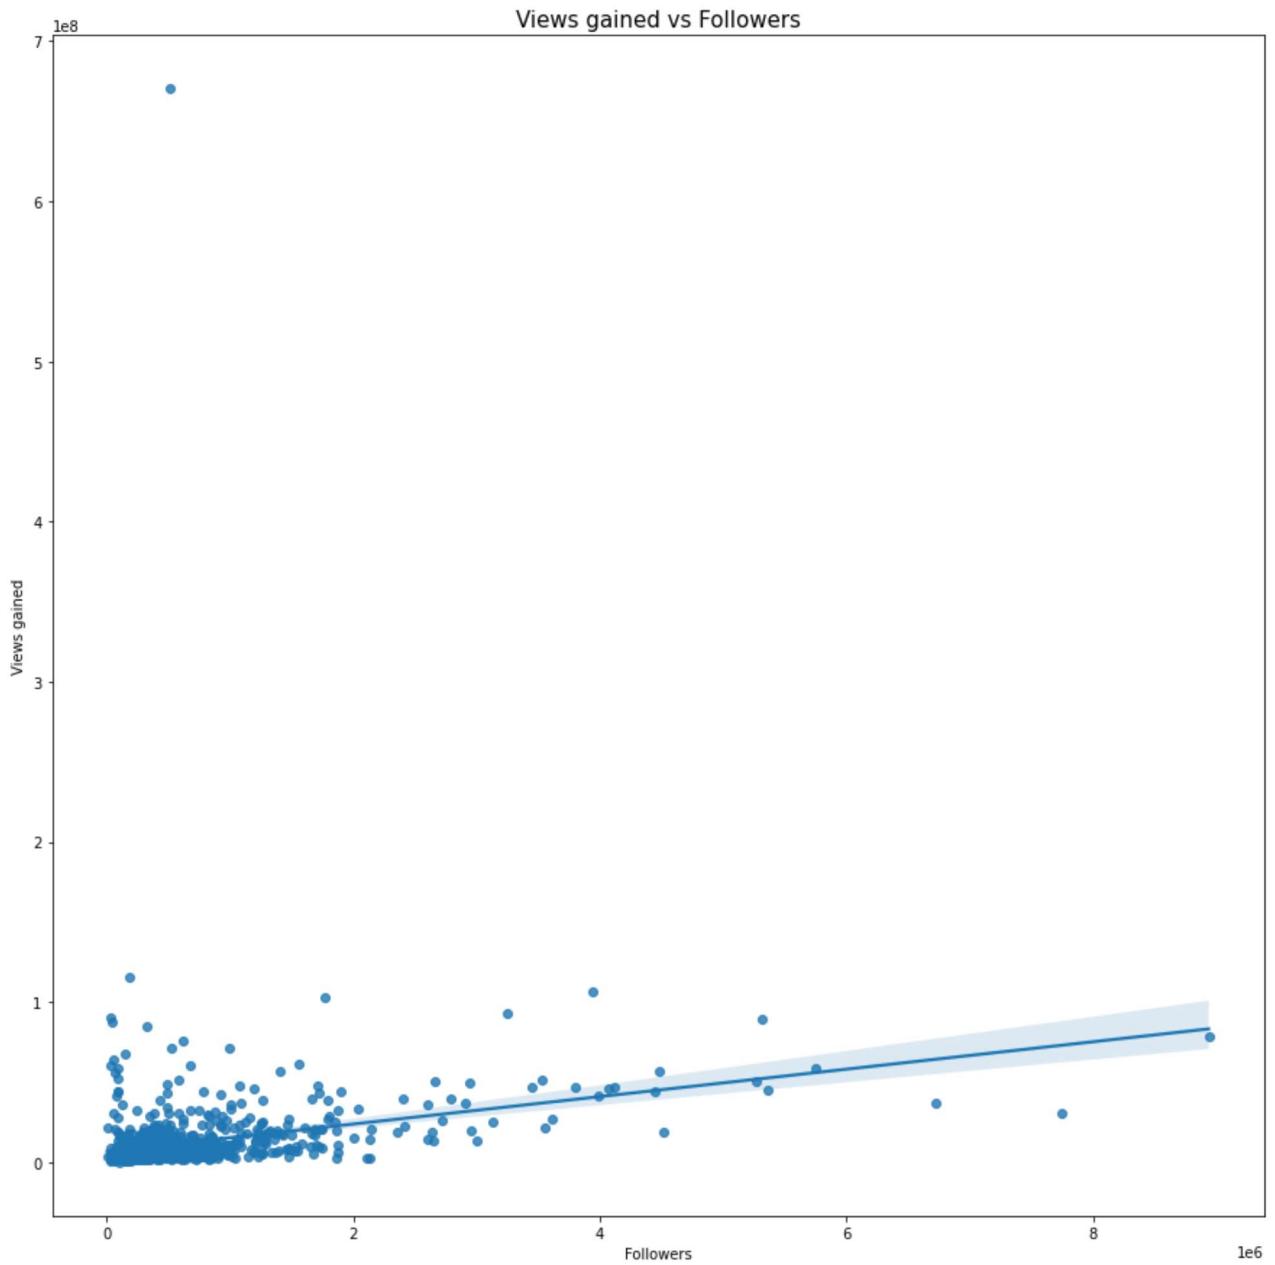

Insight: The line of linear regression tells us that there is a general positive correlation between Average viewers and Views gained, which means that streamers with a higher number of viewers generally have higher Views gained, but there are many outliers in the plot that skew our visualization and go against the norm.

Views gained compared to Followers

We want to compare and see the relationship between Views gained and Followers of a Channel. In general, channels with more Followers are more "popular", which means that they get more advertisements, endorsements, social media presence etc. Hence, we expect them to gain more views in general.

```
In [ ]: plt.figure(figsize=(15,15))
sns.regplot(x=df["Followers"], y=df["Views gained"])
plt.title("Views gained vs Followers", fontsize=15)
```

```
Out[ ]: Text(0.5, 1.0, 'Views gained vs Followers')
```

Insight: Once again, we see a general positive correlation. In this case, more data points follow the general trend of the regression line and the outliers, apart from one, are not too distant from the linear regression line, which means that Followers is a better metric to gauge Views gained than Average viewers.

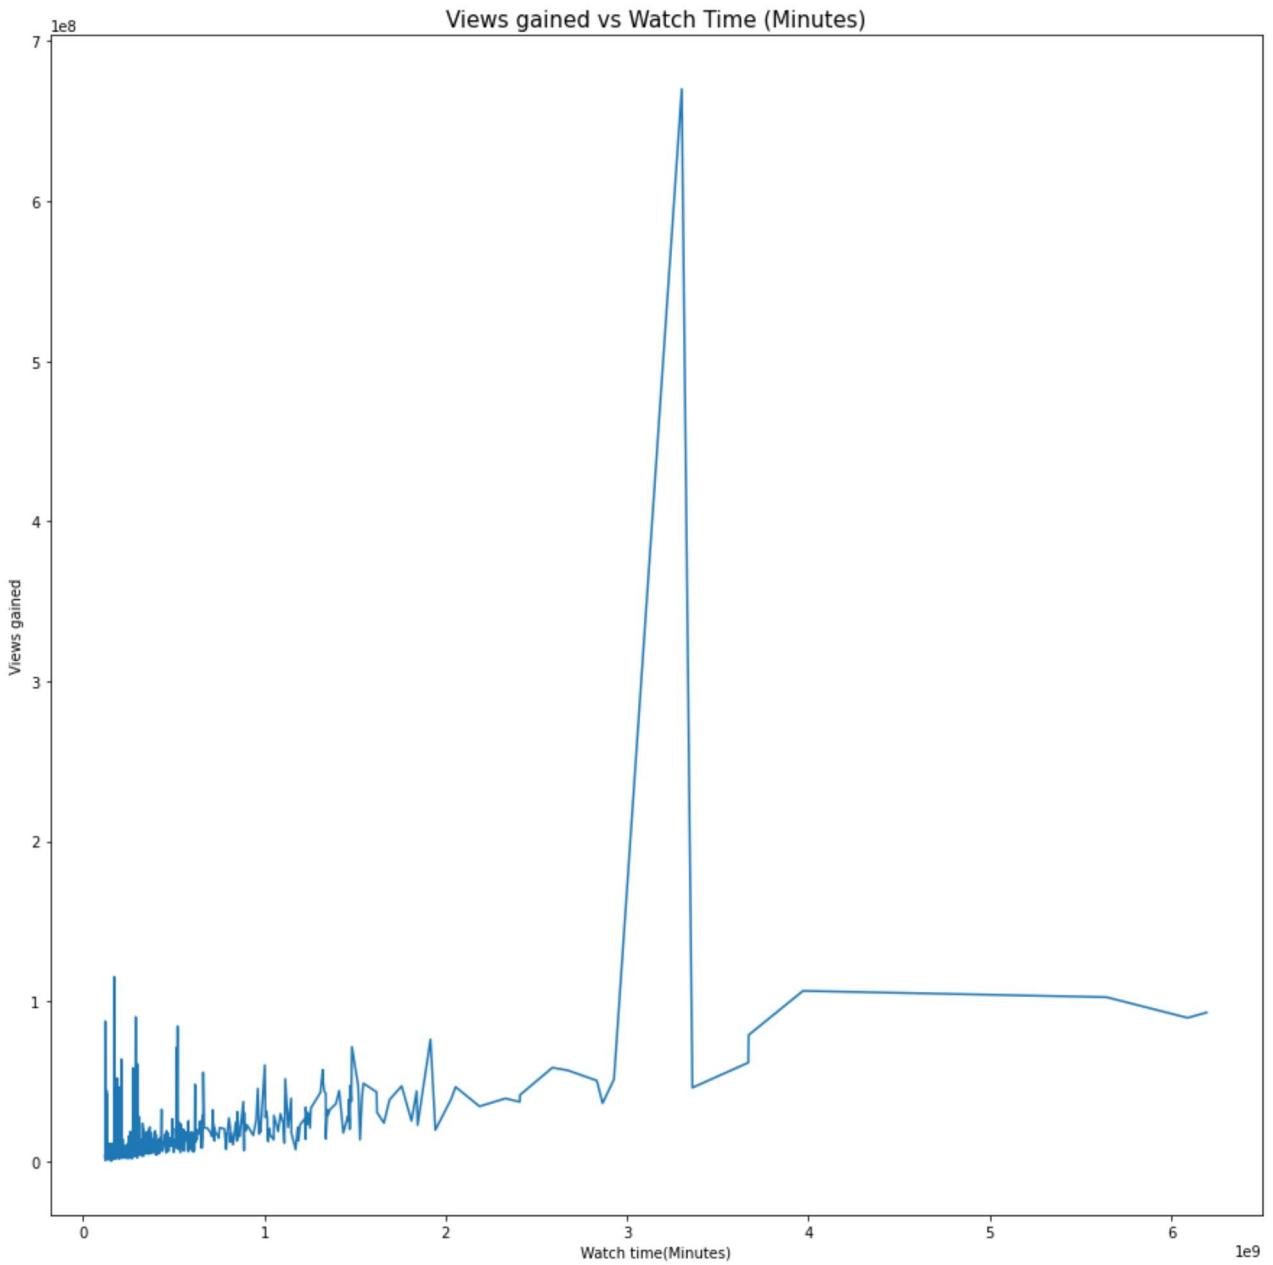

Views gained compared to Watch Time

We want to compare Views gained to Watch time(Minutes) of a channel. In general, a channel with more minutes of Watch time has more followers (based on the correlation heat map), which means more opportunities to gain more viewers.

```
In [ ]:
```

```
plt.figure(figsize=(15,15))
sns.lineplot(x=df["Watch time(Minutes)"], y=df["Views gained"])
```

```
plt.title("Views gained vs Watch Time (Minutes)", fontsize=15)
plt.show()
```

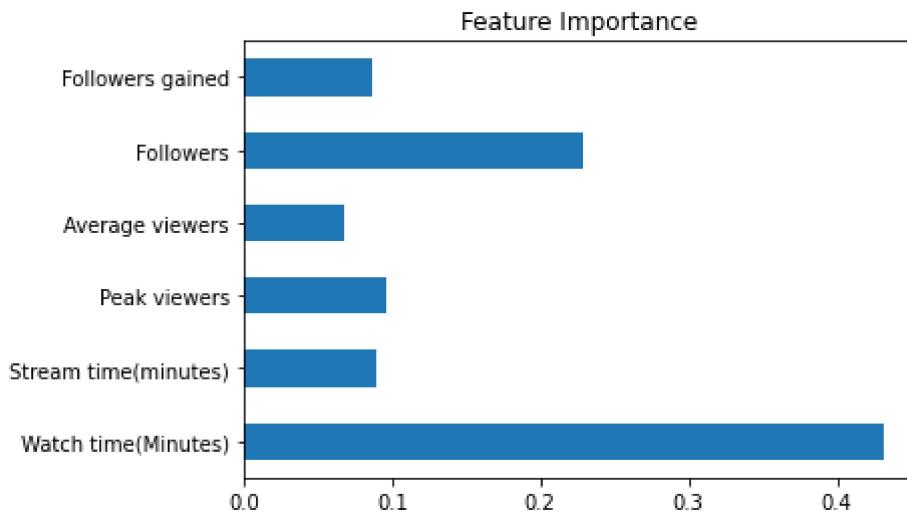

Insight: This line plot between Views gained and Watch time (minutes) is a curious one. From the heatmap above, we got the sense that these 2 variables are somewhat correlated, with a correlation value of 0.53. However, there many variations and spikes in the visualization, especially the giant outlier peak. This tells us that some of these extreme values probably skew the correlation in favor of the Watch time (minutes) variable.

Analyzing Feature Importance

To answer our initial question about which variables affect Views gained the most, we perform regression using the ExtraTreesRegressor method from Scikit-learn library. We use this particular method to avoid overfitting provide accurate results. We focus on the quantitative variables for this calculation and ignore "Partnered", "Mature" and "Language" columns because we have already seen that they barely affect the Views gained metric.

```
In [ ]: x = df.drop(["Channel", "Views gained", "Partnered", "Mature", "Language"], axis=1)
y = df["Views gained"]
model = ExtraTreesRegressor()
model.fit(x, y)
feature_importance = pd.Series(model.feature_importances_, index=x.columns)
feature_importance.plot(kind="barh", title="Feature Importance")
```

```
Out[ ]: <AxesSubplot:title={'center':'Feature Importance'}>
```

Insight: As expected, Watch time(minutes) is the most impactful variable in determining Views gained for a channel. This calculation is useful for developing regression models to make predictions.

Note: It is worth mentioning that while this dataset has a lot of information, it is missing a major indicator which would help make better assessments about the variables in question. That indicator is Games Played. Twitch streamers become popular by playing games that are trending, and this trend changes by the week. To make better predictions for Views gained, specific information about which games are streamed by a channel, and the popularity of that game relative to the overall gaming industry would probably be very important information, and probably help our understanding of the dataset immensely.
